A DCC Layout can be built in stages. The rate that you convert to DCC is entirely up to you. The steps below show a possible progression, however it is your choice as to how many of these steps you adopt. Step 1 All you need to get running with DCC is a Control System (DCC Command station) and a loco fitted with a DCC decoder.

#### A General Guide to DCC

RED WIRE – this is to pick up power from the track. Traditionally, this should be connected to the pickups that collect power from the RIGHT rail (That is, right from the loco driver point of view). BLACK WIRE – this is also to pick up power from the track. Traditionally this should be connected

However, as with any electric railway, there is wiring to be done, but because DCC controls the locomotives individually, there is no need to split the track into many sections in order to run multiple locos, making DCC layouts easier to wire than DC. The principle of wiring a DCC layout is simple- supply power to all areas of the layout, avoiding the possibility of any short circuits.
